

Keep Newfoundland and Labrador frack-free

What, really, is hydraulic fracking good for? Many dangerous chemicals are used that affect water quality and the environment and the scores of animal life that maintain a balance in nature. Fracking is also deeply suspect as a cause of earthquakes.

Canada has not endeared itself to the rest of the world in its cavalier dismissal of the reality and dangers to the environment of global warming and extensive chemical pollution, and there are strong initiatives against buying Canadian oil and gas and initiatives toward even boycotting products produced by any country that uses them. Oil and gas companies are heavily subsidized by governments that should be spending taxes in the direction of the green energy that is catching on everywhere and will also be extremely profitable for those who can disentrall themselves from the spell of Big Oil and Gas and join the real world. We have no time left to waste on this destructive foolishness.

Sincerely,

D. Eisler
