

Keep Newfoundland and Labrador frack-free

The negative impacts of fracking for the extraction of shale oil cannot be overstated. Fracking pollutes both our air and our water (through leakage).

The selling feature of fracking is always the full-time job creation but the estimates are always overblown and besides, we need to change course as we have a responsibility to this earth to drastically and quickly reduce our green-house gas emissions. As a big country, we should be leading the way!

More jobs are being created in "green" jobs and industries, that's the direction we all need to courageously take.

Sincerely,

J. Henri
