

Keep Newfoundland and Labrador frack-free

The scientific formula for forcing something in is that you force something out. In Alberta fracking has forced thousands of acres of land to suffer the oozing oil that nobody admits comes from forcing millions and millions of gallons of water into the earth. Nobody has come up with a way to stop it and that is probably because what forced it to the top is still under it. Minor earthquakes and tremors are the result of changing the pressure under ground.

We are beginning to realize that water is valuable and the supply of it not open ended. What we are forcing into the earth is water we may need to drink and sustain life. They sure aren't shoving water under ground in California and nothing says Canada won't suffer the same weather conditions.

No fracking in Newfoundland or Labrador, for everyone's benefit.

Sincerely,

M.Cook
