

We get one shot with this planet. The environmental effects of fracking cannot be undone. We have seen the evidence in Australia and the US. If we turn our island into a toxic waste land where do we go? If we continue to destroy table water around the planet and pollute or drinking water, allow carcinogenic fumes to seep into our produce and livestock... How do we eat? Short term financial gain for long term pain. Its not just the fracking process that creates environmental destruction its also the holding ponds for the contaminated water which seeps into the surrounding land mass and pollutes everything in its path. Greed and money will not keep us alive. Common sense about the environmental impact coal seam gas mining cannot be ignored. Don't close your eyes to fill your pockets. Its short term financial benefit and once the boom is over the devastation stays. Our island is rich is wind and water power. Necessary development in the renewable energy sector need to addressed. Renewable energy is the way of the future. Re invest the efforts into a sector which will be beneficial for our children not kill them with disease. It's disheartening to see what our generation is doing to this planet that we call home. Are we thinking about future generations or just ourselves. We are smart people and we know what we are doing...
