

Opposed to an Impending Future of Fracking

To Whom this may concern:

Voicing my concerns as a member of the younger Generation Z crowd; investing in fracking is not the clean energy future we're looking for.

The province of Newfoundland should follow suit with Nova Scotia and implement legislation to ban the practise of fracking for good. Once this issue is finally laid to rest, Newfoundland should set its sights and hopes on renewable energy (just one of countless examples that comes to mind: can you imagine wind turbines near Wreckhouse!). This is not to say that renewable energy doesn't pose its own sets of challenges as well (mind you the overall **risk** is minuscule compared to fracking - or any kind of fossil fuels exploration for that matter), but implemented properly, the technology is there and has already been put to creative use - especially within cities and communities in parts of Europe, which could be used as role models and building blocks for the futures of Newfoundlanders both now and for generations to come.

With great sincerity,
R. Kennedy
